3.1 Draw a Calendar with Turtle

Listing 1: Turtle Calendar Example

```
1 import turtle
2 t = turtle.Turtle()
3
4 def line(x1,y1,x2,y2):
5     t.up()
6     t.goto(x1,y1)
7     t.down()
8     t.goto(x2,y2)
9
10 def table():
11     for i in range(7):
12         line(-200,200-i*40,220,200-i*40)
13     for i in range(8):
14         line(-200+i*60,200,-200+i*60,-40)
15
16 def tex():
17     t.up()
18     t.goto(-20,220)
19     t.color('blue')
20     t.write('January-2014', False, "center", "Arial-24")
21     t.goto(-170,170)
22     t.color('red')
23     t.write('S', False, "center", "Arial-24")
24     t.goto(-110,170)
25     #t.color('red')
26     t.write('M', False, "center", "Arial-24")
27     t.goto(-50,170)
28     #t.color('red')
29     t.write('T', False, "center", "Arial-24")
30     t.goto(10,170)
31     #t.color('red')
32     t.write('W', False, "center", "Arial-24")
33     t.goto(70,170)
34     #t.color('red')
35     t.write('T', False, "center", "Arial-24")
36     t.goto(130,170)
```

```

37 | #t.color('red')
38 | t.write('F', False, "center", "Arial-24")
39 | t.goto(190,170)
40 | #t.color('red')
41 | t.write('S', False, "center", "Arial-24")
42 |
43 | x = -170
44 | y = 130
45 | pos = 1
46 | t.color('black')
47 | for day in range(1,32):
48 |     t.goto(x,y)
49 |     t.write(day, False, "center", "Arial-24")
50 |     x += 60
51 |     pos += 1
52 |     if(pos > 7):
53 |         x = -170
54 |         y -= 40
55 |         pos = 1
56 def main():
57     t.speed(10)
58     table()
59     tex()
60     turtle.exitonclick()
61 main()

```

January 2014

S	M	T	W	T	F	S
1	2	3	4	5	6	7
8	9	10	11	12	13	14
15	16	17	18	19	20	21
22	23	24	25	26	27	28
29	30	31

3.2 Calculate PI using Monte Carlo Method

Consider a circle inscribed in a unit square. Given that the circle and the square have a ratio of areas that is $\pi/4$, the value of π can be approximated using a Monte Carlo method.

- Draw a square on the ground, then inscribe a circle within it.
- Uniformly scatter some objects of uniform size (grains of rice or sand) over the square.
- Count the number of objects inside the circle and the total number of objects.
- The ratio of the two counts is an estimate of the ratio of the two areas, which is $\pi/4$. Multiply the result by 4 to estimate π .

Listing 2: Calculate PI by simulation

```

1 import random
2 import math
3 import turtle
4
5 def line(t,x1,y1,x2,y2):
6     t.up()
7     t.goto(x1,y1)
8     t.down()
9     t.goto(x2,y2)
10
11 def showMontePi(numDarts):
12     wn = turtle.Screen()
13     t = turtle.Turtle()
14     t.speed(10)
15     wn.setworldcoordinates(-2,-2,2,2)
16
17     line(t,-1,0,1,0)
18     line(t,0,1,0,-1)
19     circle = 0
20     t.up()
21     for i in range(numDarts):
22         x = random.random()
23         y = random.random()
24
25         d = (math.sqrt(x**2 + y**2))
26         t.goto(x,y)
27         if(d <= 1):
28             circle += 1
29             t.color('red')
30         else:
31             t.color('blue')
32             t.dot()
33     pi = circle / numDarts * 4
34     t.goto(0.2,-0.5)
35     t.write(pi, 'center', font=("Arial", 20, "normal"))
36     turtle.exitonclick()
```

```

37     return pi
38 def main():
39     showMontePi(1000)
40 main()

```

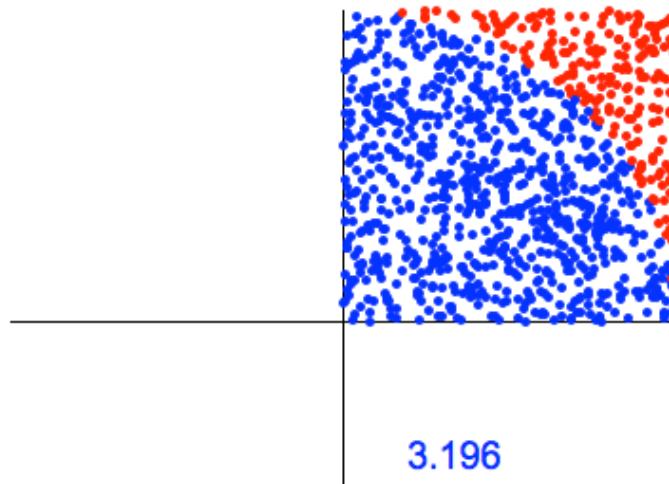

Figure 3.2: Calculate PI using Monte Carlo Method

3.3 Strings

Listing 3: Iterate each character in a string

```

1 str="hello_world"
2 for c in str:
3     print(c)

```

3.3.1 Count the frequency of letters

In this example, we count the frequencies of letters [a-z] in the book “War and Peace” by Leo Tolstoy, and draw a bar graph based on the frequency.

Listing 4: Letter Frequency Example

```

1 import turtle
2 def letterFreq(filename):
3     freq = [0 for i in range(128)]
4     instr = open(filename, "r")
5     count = 0
6     for s in instr:
7         s = s.lower()
8         #print(s)

```

```
9     for c in s:
10        freq[ord(c)] += 1
11    count += 1
12    print(count)
13    #print(freq)
14    instr.close()
15    return freq
16 def drawRect(t, left, top, right, bottom):
17     t.up()
18     t.goto(left, top)
19     t.down()
20     t.pensize(10)
21     t.goto(right, bottom)
22 def drawBar(fr, t):
23     t.up()
24     x = -250
25     y = 0
26     for i in range(97, 97+26):
27         y = fr[i] / 1000
28         drawRect(t, x, y, x, 0)
29         t.up()
30         t.goto(x, -40)
31         t.write(chr(i), 'left', font=("Arial", 20, "normal"))
32         x += 20
33
34 def main():
35     t = turtle.Turtle()
36     #change the path on your computer
37     file = "/Users/anwar/Desktop/war-peace.txt"
38     fr = letterFreq(file)
39     #for i in range(32, 128):
40     #    if(i >= 97 and i <= 97+26):
41     #        print(chr(i), end=' ')
42     #        print(fr[i])
43     drawBar(fr, t)
44     turtle.exitonclick()
45 main()
```

Figure 3.3: Letter frequency

3.3.2 Count the frequency of words

In this example, we count the frequencies of words in the book “War and Peace” by Leo Tolstoy, and display most frequent words.

Listing 5: Word Frequency Example

```
1 import re
2 def letterFreq(filename):
3     freq=dict()
4     #print(freq)
5     instr = open(filename , "r")
6     count = 0
7     for s in instr:
8         #print(s)
9         s = s.lower()
10        #words = s.split()
11        words = re.sub(r'[.?/*\$%\n,]', ' ', s).split()
12        for word in words:
13            if(freq.get(word) is None):
14                freq[word] = 1
15            else:
16                freq[word] += 1
17
18            count +=1
19    instr.close()
20    #print(freq)
```

```

21     return freq
22
23 def main():
24
25     file = "/Users/anwar/Desktop/war+peace.txt"
26     fr = letterFreq(file)
27     sorted_list = sorted(fr, key=lambda x: fr[x], reverse=True)
28     for key in range(10): #display most frequent 10 words
29         print(sorted_list[key], end="\t")
30         print(fr.get(sorted_list[key]))
31 main()

```

Listing 6: Word Frequency Output

1	the	34488
2	and	22199
3	to	16661
4	of	14861
5	a	10512

10	was	7342

3.3.3 Anagrams

An anagram is a type of word play, the result of rearranging the letters of a word or phrase to produce a new word or phrase, using all the original letters exactly once; for example Doctor Who can be rearranged into Torchwood. This program receives an input from user, and lists all words from a dictionary that can be constructed using the user the letters of the user input. For example: “Lord Voldemort” can be constructed from “Tom Marvolo Riddle”.

Listing 7: Word Frequency Output

```

1 def contains(user_input, word):
2     for c in word:
3         pos = user_input.find(c)
4         if(pos == -1):
5             return False
6         else:
7             word = word[:pos] + word[pos+1:]
8     return True
9 def readWord(file, user_input):
10    fin = open(file, "r")
11    for word in fin:
12        word = word.strip()
13        if(len(word) >= 3 and contains(user_input, word)):
14            print(word)
15 def main():

```

```
16     filename = "/Users/anwar/Desktop/wordlist.txt" #dictionary file
17     user_input = input("Enter a word:")
18     readWord(filename, user_input)
19 main()
```
