

Array variable review
`int [] A = new int [3]`

variable that
stores a
"reference" to
an array

array same/different Func

Can we do:

returns $A == B$?

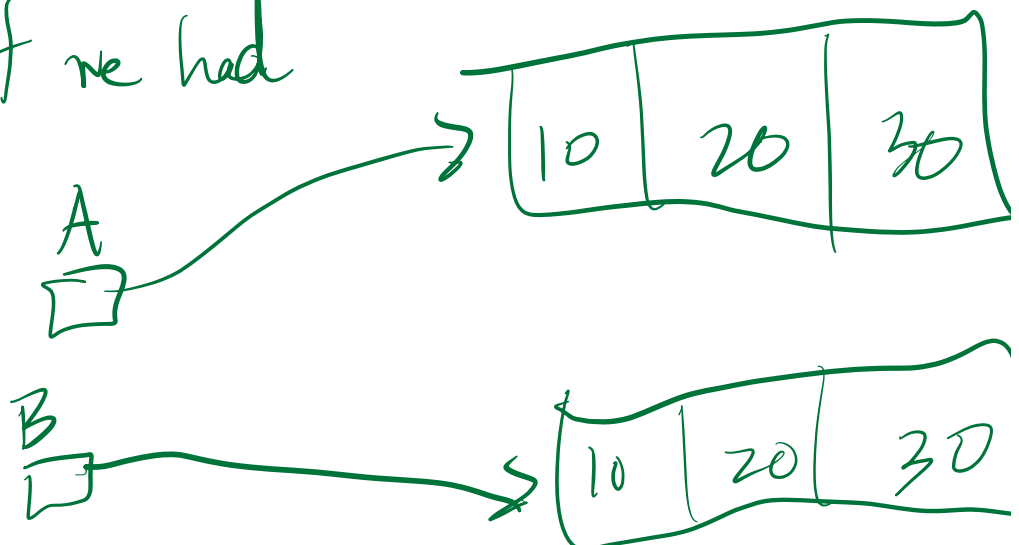

(1) would it compile?

Yes

(2) what does this do?

returns whether or not the locations are the same

so if we had

"Shallow comparison"

we want a "deep comparison"

boolean same (int [A,
int [B])
