Dynamic Searchable Symmetric Encryption

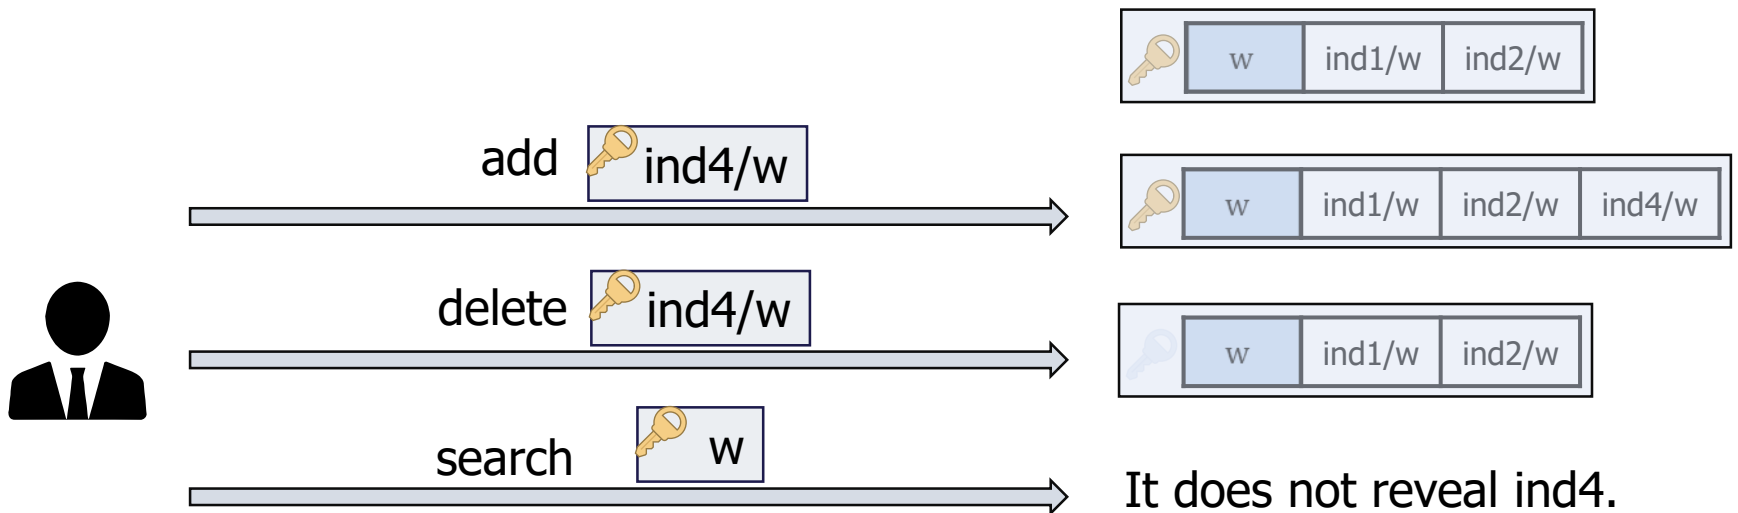

With the trade of security and efficiency, most of the existing DSSE schemes leak some information (e.g., search pattern) in data search and update phases.

Forward and Backward Privacy

- Forward privacy (FP) requires that the newly added files cannot be linked to previous search tokens.

- Backward privacy (BP): the deleted files cannot be searched any more.

Research Status

- Keyword-level updates
 - The client needs to know all keywords contained in the document to be updated in advance
 - CCS'15 Sophos, CCS'17 Janus, CCS'18 Janus++
- Document-level deletions
 - The client requires only an identifier of the document in the deletion operation
 - TDSC'21 Khons (the storage cost at the client is linear with the number of documents.)
- Actual deletion
 - Many FP/BP schemes perform the deletion in the same way as the addition
 - CCS'15 Sophos, TDSC'20 FAST

Document-based Backward Privacy (DBP)

Threat model: the server is considered to be honest-but-curious (HBC).

| Document | Keywords |
|----------|------------|
| ind_1 | w_1, w_2 |
| ind_2 | w_2, w_3 |

Client:

secret key: k_1

| T_C | |
|---------|-------------|
| keyword | key |
| w_1 | key^{w_1} |
| w_2 | key^{w_2} |
| w_3 | key^{w_3} |

Server:

| T_e | |
|--|---|
| keyind | Value set (e) |
| $F_{k_1}(ind_1)$ | $H_1(F_{k_1}(ind_1), key^{w_1}) \oplus \langle ind_1, \mathbf{0} \rangle$ |
| | $H_1(F_{k_1}(ind_1), key^{w_2}) \oplus \langle ind_1, \mathbf{0} \rangle$ |
| $F_{k_1}(ind_2)$ | $H_1(F_{k_1}(ind_2), key^{w_2}) \oplus \langle ind_2, \mathbf{0} \rangle$ |
| | $H_1(F_{k_1}(ind_2), key^{w_3}) \oplus \langle ind_2, \mathbf{0} \rangle$ |

| T_P | |
|-------------|-------------------------------|
| keyword | ind |
| key^{w_1} | ind_1 |
| | |
| | |
| | |

search token: $(F_{k_1}(w_1), key^{w_1})$

$mask \leftarrow (keyind, F_{k_1}(w_1)) \quad mask \oplus e \rightarrow$ 0?

deletion token: $(F_{k_1}(ind_1), ind_1)$

Advanced DBP: 2 Round Trip

Client:

secret key: k_1

| T_C | |
|---------|--------------|
| keyword | key |
| w_1 | $key^{w'_1}$ |
| w_2 | key^{w_2} |
| w_3 | key^{w_3} |

Server:

| T_e | |
|------------------|--|
| keyind | Value set (e) |
| $F_{k_1}(ind_1)$ | $H_1(F_{k_1}(ind_1), key^{w_1}) \oplus \langle ind_1, \mathbf{0} \rangle$ $H_1(F_{k_1}(ind_1), key^{w_2}) \oplus \langle ind_1, \mathbf{0} \rangle$ |
| $F_{k_1}(ind_2)$ | $H_1(F_{k_1}(ind_2), key^{w_2}) \oplus \langle ind_2, \mathbf{0} \rangle$ $H_1(F_{k_1}(ind_2), key^{w_3}) \oplus \langle ind_2, \mathbf{0} \rangle$ |

| T_P | |
|-------------|---------|
| keyword | ind |
| key^{w_1} | ind_1 |
| | |
| | |
| | |

The server may be attacked by the external attackers, who can obtain control over the server.

$$H_1(F_{k_1}(ind_1), key^{w_1}) \oplus \langle ind_1, \mathbf{0} \rangle \quad \longrightarrow \quad H_1(F_{k_1}(ind_1), key^{w_1}) \oplus \langle Enc(k_2, ind_1), \mathbf{0} \rangle$$

DBP*: Improved Search Speed

| T_e | |
|------------------|--|
| keyind | Value set (e) |
| $F_{k_1}(ind_1)$ | $H_1(F_{k_1}(ind_1), key^{w_1}) \oplus \langle ind_1, \mathbf{0} \rangle$ $H_1(F_{k_1}(ind_1), key^{w_2}) \oplus \langle ind_1, \mathbf{0} \rangle$ |
| $F_{k_1}(ind_2)$ | $H_1(F_{k_1}(ind_2), key^{w_2}) \oplus \langle ind_2, \mathbf{0} \rangle$ $H_1(F_{k_1}(ind_2), key^{w_3}) \oplus \langle ind_2, \mathbf{0} \rangle$ |

$$mask \leftarrow (\text{keyind}, F_{k_1}(w_1))$$

$$mask \oplus e \rightarrow \text{orange box} \text{ 0? } \text{green box}$$

Dual – key/value: $(\langle key_1, key_2 \rangle, value)$

$$key_1 = F_{k_1}(ind_1)$$

$$value = e_{1\dots\lambda}$$

$$key_2 = e_{\lambda+1\dots 2\lambda}$$

- Search

$$mask \leftarrow (\text{keyind}, F_{k_1}(w_1))$$

$$\langle F_{k_1}(ind_1), mask_{\lambda+1\dots 2\lambda} \rangle$$

$$ind \leftarrow mask_{1\dots\lambda} \oplus value$$

Experiments

● Instantiation

- Implementation: Java
- Intel(R) Xeon(R) Gold 5218 CPU of 2.3GHz and 128GB RAM

| Dataset | Data size(GB) | Documents number | Keywords number | Pairs number |
|------------------------|---------------|------------------|-----------------|--------------|
| Enron ¹ | 1.56 | 577,744 | 54,021 | 2,888,720 |
| Wikipedia ² | 10.6 | 3,506,761 | 957,920 | 17,533,805 |

● Setup and update

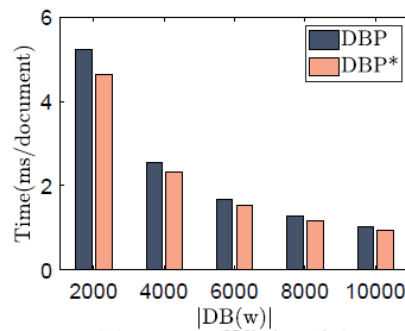

| Dataset | DBP-B | | | | | DBP-E | | | | |
|-----------|----------|-----------|-----------|----------------|----------|----------------|----------|-----------|-----------|----------------|
| | Setup | | Addition | Deletion | Deletion | Setup | | Addition | Deletion | |
| | Time(ms) | Size1(MB) | Size2(MB) | Time(μ s) | | Time(μ s) | Time(ms) | Size1(MB) | Size2(MB) | Time(μ s) |
| Enron | 8727 | 2.78 | 274 | 15.11 | 2.25 | 11471 | 2.78 | 274 | 19.85 | 8.57 |
| Wikipedia | 60073 | 50.07 | 1662 | 18.18 | 2.30 | 75955 | 50.07 | 1662 | 21.66 | 9.16 |

Size1: the storage cost (σ) at the client side, Size2: the storage cost (EDB) at the server side.

● Search

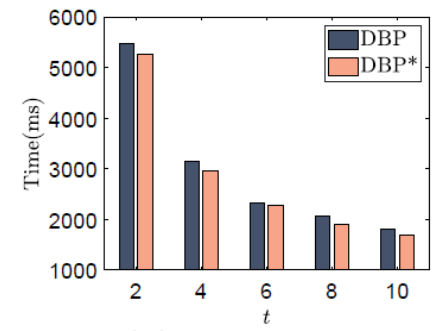

(a) $t = 1$ (Enron)

(b) $t = 1$ (Wikipedia)

(c) $DB(w) = 10000$ (Enron)

(d) $DB(w) = 10000$ (Wikipedia)

Conclusion

In this work:

- Devise an efficient forward and backward private scheme, which supports document-based immediate deletion
- Implement our scheme on two real datasets and show its practicality

Thanks for your attention!
