

## Section 7.1 Relations and Their Properties

---

---

**Definition:** A *binary relation*  $R$  from a set  $A$  to a set  $B$  is a subset  $R \subseteq A \times B$ .

Note: there are no constraints on relations as there are on functions.

We have a common graphical representation of relations:

**Definition:** A *Directed graph* or a *Digraph*  $D$  from  $A$  to  $B$  is a collection of *vertices*  $V \subseteq A \cup B$  and a collection of *edges*  $R \subseteq A \times B$ . If there is an ordered pair  $e = \langle x, y \rangle$  in  $R$  then there is an *arc* or *edge* from  $x$  to  $y$  in  $D$ . The elements  $x$  and  $y$  are called the *initial* and *terminal* vertices of the edge  $e$ .

---

Examples:

- Let  $A = \{ a, b, c \}$
- $B = \{ 1, 2, 3, 4 \}$
- $R$  is defined by the ordered pairs or edges

$$\{ \langle a, 1 \rangle, \langle a, 2 \rangle, \langle c, 4 \rangle \}$$

can be represented by the digraph  $D$ :

**Definition:** A binary relation  $R$  on a set  $A$  is a subset of  $A \times A$  or a relation from  $A$  to  $A$ .

Example:

- $A = \{a, b, c\}$
- $R = \{ \langle a, a \rangle, \langle a, b \rangle, \langle a, c \rangle \}$ .

Then a digraph representation of  $R$  is:

Note: An arc of the form  $\langle x, x \rangle$  on a digraph is called a *loop*.

Question: How many binary relations are there on a set  $A$ ?

## Special Properties of Binary Relations

Given:

- A Universe  $U$
- A binary relation  $R$  on a subset  $A$  of  $U$

**Definition:**  $R$  is *reflexive* iff

$$\forall x [x \in U \rightarrow \langle x, x \rangle \in R]$$

Note: if  $U = \emptyset$  then the implication is true vacuously

The void relation on a void Universe is reflexive!

Note: If  $U$  is not void then all vertices in a reflexive relation must have loops!

---

**Definition:**  $R$  is *symmetric* iff

$$\forall x, y [\langle x, y \rangle \in R \rightarrow \langle y, x \rangle \in R]$$

Note: If there is an arc  $\langle x, y \rangle$  there must be an arc  $\langle y, x \rangle$ .

---

**Definition:**  $R$  is *antisymmetric* iff

$$x \neq y [ \langle x, y \rangle \in R \wedge \langle y, x \rangle \in R \implies x = y ]$$

Note: If there is an arc from  $x$  to  $y$  there cannot be one from  $y$  to  $x$  if  $x \neq y$ .

You should be able to show that logically: if  $\langle x, y \rangle$  is in  $R$  and  $x \neq y$  then  $\langle y, x \rangle$  is not in  $R$ .

---

**Definition:**  $R$  is *transitive* iff

$$x \neq y \neq z [ \langle x, y \rangle \in R \wedge \langle y, z \rangle \in R \implies \langle x, z \rangle \in R ]$$

Note: if there is an arc from  $x$  to  $y$  and one from  $y$  to  $z$  then there must be one from  $x$  to  $z$ .

This is the most difficult one to check. We will develop algorithms to check this later.

Examples:

A.

B.

C.

D.

A: not reflexive  
symmetric  
antisymmetric  
transitive

B: not reflexive  
not symmetric  
not antisymmetric  
not transitive

C: not reflexive  
not symmetric  
antisymmetric  
not transitive

D: not reflexive  
not symmetric  
antisymmetric  
transitive

# Combining Relations

## Set operations

A very large set of potential questions -

Let  $R_1$  and  $R_2$  be binary relations on a set  $A$ :

If  $R_1$  has property 1

and

$R_2$  has property 2,

does

$R_1 * R_2$  have property 3

where  $*$  represents an arbitrary binary set operation?

Example:

If

- $R_1$  is symmetric,

and

- $R_2$  is antisymmetric,

does it follow that

- $R_1 \cap R_2$  is transitive?

If so, prove it. Otherwise find a counterexample.

---

Example:

Let  $R_1$  and  $R_2$  be transitive on  $A$ . Does it follow that

$$R_1 \cap R_2$$

is transitive?

Consider

- $A = \{1, 2\}$
- $R_1 = \{\langle 1, 2 \rangle\}$
- $R_2 = \{\langle 2, 1 \rangle\}$

Then  $R_1 \cap R_2 = \{\langle 1, 2 \rangle, \langle 2, 1 \rangle\}$  which is not transitive!  
(Why?)

---

## Composition

**Definition:** Suppose

- $R_1$  is a relation from  $A$  to  $B$
- $R_2$  is a relation from  $B$  to  $C$ .

Then the composition of  $R_2$  with  $R_1$ , denoted  $R_2 \circ R_1$  is the relation from  $A$  to  $C$ :

If  $\langle x, y \rangle$  is a member of  $R_1$  and  $\langle y, z \rangle$  is a member of  $R_2$  then  $\langle x, z \rangle$  is a member of  $R_2 \circ R_1$ .

---

Note: For  $\langle x, z \rangle$  to be in the composite relation  $R_2 \circ R_1$  there must exist a  $y$  in  $B$  . . . .

Note: We read them right to left as in functions.

---

Example:

$$R_2 \circ R_1 = \{ \langle b, D \rangle, \langle b, B \rangle \}$$

---

**Definition:** Let  $R$  be a binary relation on  $A$ . Then

$$\text{Basis: } R^1 = R$$

$$\text{Induction: } R^{n+1} = R^n \circ R$$

---

Note: an ordered pair  $\langle x, y \rangle$  is in  $R^n$  iff there is a *path* of length  $n$  from  $x$  to  $y$  following the arcs (in the direction of the arrows) of  $R$ .

Example:

---

Very Important  
**Theorem:**

$R$  is transitive iff  $R^n \subseteq R$  for  $n > 0$ .

Proof:

1.  $R$  transitive  $\iff R^n \subseteq R$

Use a direct proof and a proof by induction:

- Assume  $R$  is transitive.
- Now show  $R^n \subseteq R$  by induction.

*Basis:* Obviously true for  $n = 1$ .

*Induction:*

- The induction hypothesis:

'assume true for  $n$ '.

- Show it must be true for  $n + 1$ .

$R^{n+1} = R^n \circ R$  so if  $\langle x, y \rangle$  is in  $R^{n+1}$  then there is a  $z$  such that  $\langle x, z \rangle$  is in  $R^n$  and  $\langle z, y \rangle$  is in  $R$ .

But since  $R^n \subseteq R$ ,  $\langle x, z \rangle$  is in  $R$ .

$R$  is transitive so  $\langle x, y \rangle$  is in  $R$ .

Since  $\langle x, y \rangle$  was an arbitrary edge the result follows.

---

2.  $R^n \subseteq R$  if  $R$  is transitive

Use the fact that  $R^2 \subseteq R$  and the definition of transitivity. Proof left to the student.
