

CIS 4360
Secure Computer Systems
Asymmetric Cryptography

Professor Qiang Zeng
Spring 2017

Previous Class

- Symmetric Encryption
 - Block Ciphers
 - DES (don't use it), 3-DES, AES
 - Modes of operation: ECB (don't use it), CBC, CFB
 - Stream Ciphers
 - RC4
- Message Authentication Code
 - HMAC
 - KMAC

Previous class...

When to use Stream Ciphers?

- (1) streaming data: stream ciphers can encrypt data whenever bits are generated, while block ciphers have to wait until a whole block of data has been generated
- (2) When performance is a main concern
- (3) When the length of the data to be encrypted is unknown.
With stream ciphers, you can encrypt what is currently known

Previous class...

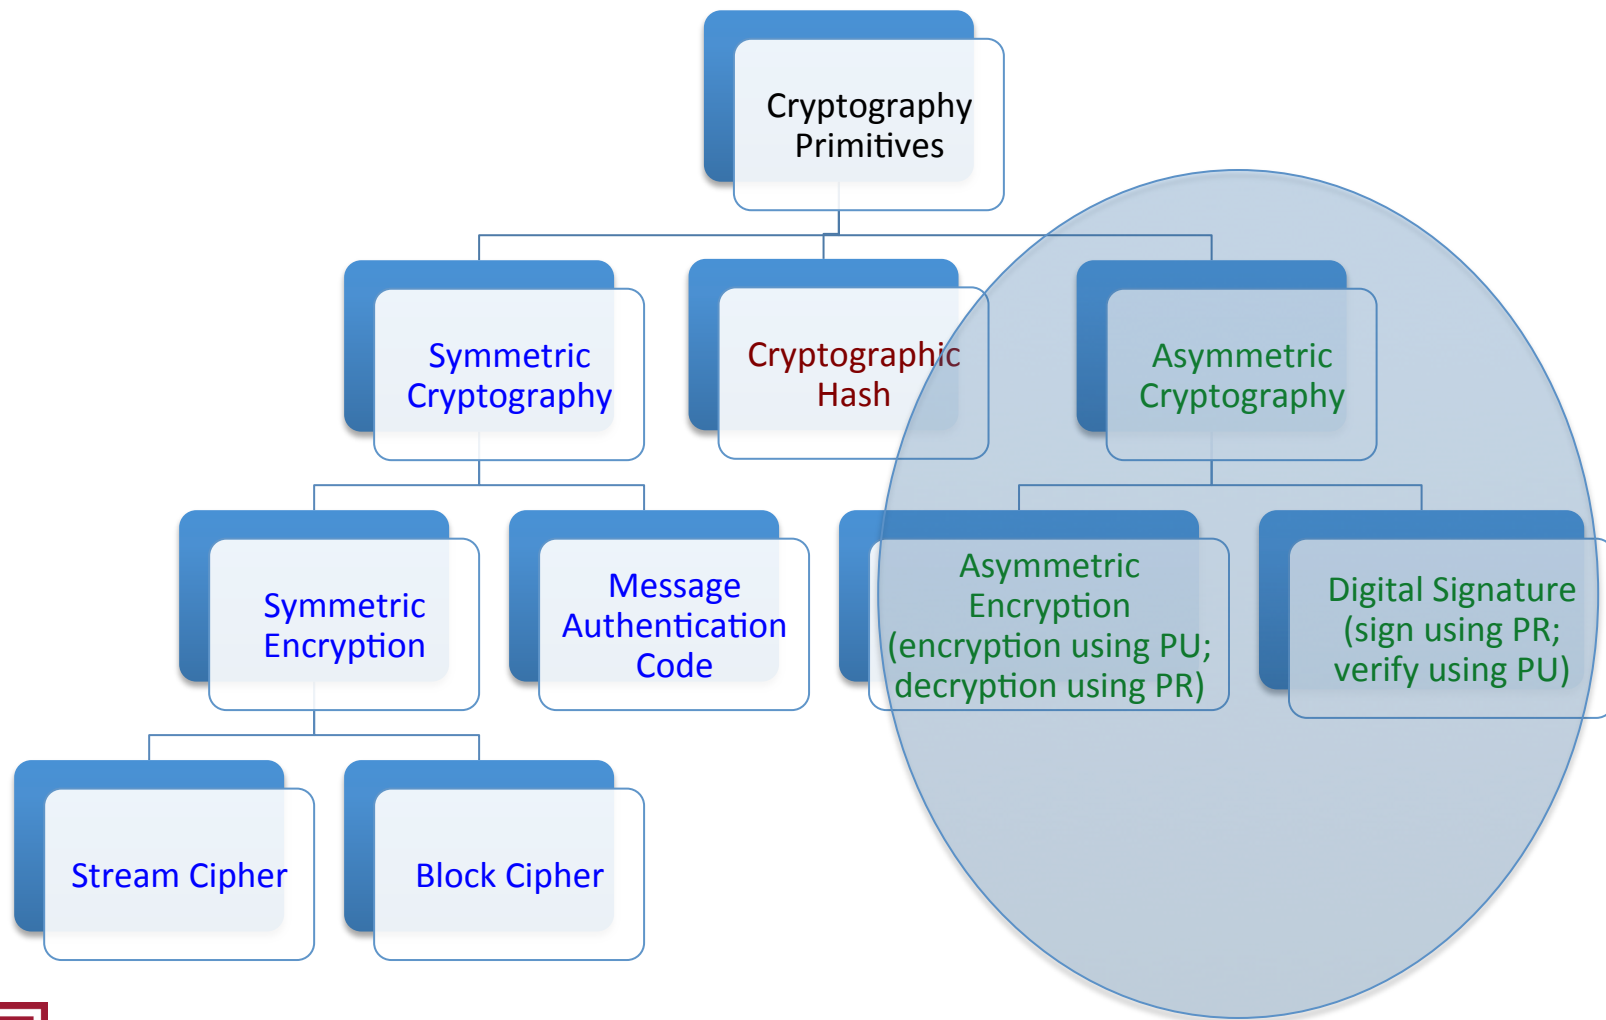

Can MAC be used to achieve non-repudiation?

No, even if A ever sent a message with the MAC tag to B, A can deny the truth and argue that B has **forged** the message.

Digital Signature is used for data integrity, authentication, and non-repudiation

Cryptography Primitives

Symmetric vs. Asymmetric Encryption

- Symmetric encryption
 - Also called *symmetric-key / secret-key / shared-key encryption*
 - Encryption: $C = E(K, P)$; Decryption: $P = D(K, C)$
 - Block cipher: e.g., **DES, AES**
 - Stream cipher: e.g., **RC4**
- Asymmetric encryption
 - Also called *asymmetric-key / public-key encryption*
 - Encryption: $C = E(PU, P)$; Decryption: $P = D(PR, C)$
 - E.g., **RSA, Elliptic Curve**

RSA (Rivest, Shamir, Adelman)

- The most widely used public key algorithm
- Its security is based on the **difficulty of integer factorization**
- Invented in 1977
- First discovered in 1973 by Clifford Cocks but kept secret until 1997 by Britain

“A Method for Obtaining Digital Signatures and Public Key Cryptosystems”, Communications of the ACM, 1978

Difficulty of Integer Factorization

- While it is easy to calculate the product of two primes $n = p \times q$, it is very expensive to determine whether a given prime can divide a large integer
 - You basically rely on trial-and-error
- E.g., $n = 91$
 - Can 3 divide n -> no!
 - Can 5 divide n -> no!
 - Can 7 divide n -> yes!

RSA Factoring Challenges

- Challenges put forward by the RSA lab to encourage research into factoring large integers

```
RSA-768 = 12301866845301177551304949583849627207728535695953347921973224521517264005
07263657518745202199786469389956474942774063845925192557326303453731548268
50791702612214291346167042921431160222124047927473779408066535141959745985
6902143413
```

```
RSA-768 = 33478071698956898786044169848212690817704794983713768568912431388982883793
878002287614711652531743087737814467999489
× 36746043666799590428244633799627952632279158164343087642676032283815739666
511279233373417143396810270092798736308917
```

The CPU time spent on the factorization is equivalent with almost **2000** years of computing on a single-core 2.2 GHz AMD Opteron-based computer.

Key Generation

n: modulus

e: public exponent or encryption exponent

d: private exponent or decryption exponent

Procedure

- Pick two primes p and q
- Compute $n = pq$
- Compute $\phi = (p-1)(q-1)$
- Choose e , $1 < e < \phi$ such that $\gcd(e, \phi) = 1$
 - greatest common divisor
- Compute d such that $de \bmod \phi = 1$
 - Public key: $\{e, n\}$
 - Private key: $\{d, n\}$

Example

- Choose $p = 3$ and $q = 11$
- Compute $n = pq = 33$
- Compute $\phi = 2 * 10 = 20$
- Choose $e = 7$ which satisfies $\gcd(7, 20) = 1$
- Compute $d = 3$ as $(3 * 7) \% 20 = 1$
 - Public key: $\{7, 33\}$
 - Private key: $\{3, 33\}$

RSA's Encryption and Decryption

Procedure

Public key: $\{e, n\}$

Private key: $\{d, n\}$

- $C = \text{Encrypt}(PU, P)$
 $= P^e \bmod n$
- $P = \text{Decrypt}(PR, C)$
 $= C^d \bmod n$

Example

Public key: $\{7, 33\}$

Private key: $\{3, 33\}$

$P = 2$

- $C = 2^7 \% 33 = 29$
- $P = 29^3 \% 33 = 2$

RSA's Digital Signature

How to sign a message?

- Create a message digest, m , of the information to be signed ($1 < m < n$)
- Use the private key to compute the signature
$$s = \text{Sign}(\text{PR}, m)$$
$$= m^d \bmod n$$
- Send the information along with the signature s

How to verify a signature?

- Independently compute the message digest, m_1 , of the information received
- Use the sender's public key to recover the message digest from s
$$m_2 = s^e \bmod n$$
- If $m_1 = m_2$, the signature is valid

Question

Can Digital Signature be used to verify data integrity, authentication, and achieve non-repudiation?

Yes. Data integrity and authentication: the adversary may corrupt or replace the information being sent, but does not have the private key to sign the message digest

Non-repudiation: only the sender can generate the digital signature, since only the sender owns the private key. Thus, the sender cannot deny that the message was signed by her/him

RSA

- When we say the key length of RSA, what does it mean on earth?
 - The bit length of the modulus $n = pq$
- What key size should I use for RSA?
 - 1024-bit key is already insecure
 - 2048-bit key is recommended until Year 2030
 - 3072 is needed beyond 2030

Key Size

Symmetric key algorithm	Comparable RSA key length	Comparable hash function	Bits of security
2TDEA*	1024	SHA-1	80
3TDEA	2048	SHA-224	112
AES-128	3072	SHA-256	128
AES-192	7680	SHA-384	192
AES-256	15360	SHA-512	256

*2TDEA: 2-key triple Data Encryption Algorithm; i.e., 3DES using two keys

** SHA-224, 256, 384, 512 all belong to SHA-2

Questions

- How large a message/digest can RSA encrypt or sign?
 - The message/digest, m , to be encrypted or signed should be smaller than the modulus n
 - E.g., with a 2048-bit key, m has to be ≤ 2048 bits
- Asymmetric Encryption (including RSA) is much more expensive than Symmetric Encryption, is it possible to combine the advantages of both?
 - In practice, Asymmetric Encryption is firstly used to establish the key
 - The established key is then used in subsequent communication through inexpensive Symmetric Encryption

RSA Caveats

- Don't use the same key for encryption and signing
 - Given that signing and decryption are essentially the same operation, if an attacker can convince a key holder to “sign” an encrypted message, then she gets the original
- Don't use a common modulus n for different users

DSA – Digital Signature Algorithm

- Another widely used signature algorithm
 - NIST 1991
 - A variant of the ElGamal Signature Scheme
- DSA vs. RSA
 - Unlike RSA, which works for both encryption and signing, DSA can only sign
 - DSA is faster than RSA when generating signatures; RSA is faster than DAS when verifying signatures
 - DSA's security is based on the difficulty of the **discrete logarithm** problem, while RSA on integer factorization

Difficulty of Discrete Logarithm

- $g^n \bmod p = m$
 - Given g, p, n , it is easy to calculate m
 - But given g, p, m , it is very difficult to calculate n
- <https://www.khanacademy.org/computing/computer-science/cryptography/modern-crypt/v/discrete-logarithm-problem>

ECC (Elliptic Curve Cryptography)

- A new approach to public-key cryptography
 - Proposed independently by Koblitz and Miller 1985
 - Based on algebraic structure of elliptic curves
- Become popular since 2004
- ECC requires smaller keys (e.g., 256bits), thus the generated signatures are smaller, reducing bandwidth and storage consumption
- But ECC is complicated and tricky to implement correctly; ECC has some uncertain patent issues

The Elliptic Curve Discrete Logarithm Problem

- <http://arstechnica.com/security/2013/10/a-relatively-easy-to-understand-primer-on-elliptic-curve-cryptography/>

Symmetric vs. Asymmetric Cryptography

- Symmetric cipher is much **faster**
- With asymmetric ciphers, you can post your Public Key to the **world** and then the world can communicate with you secretly without having to meet you first
 - Why?
 - Only you have the private key to decrypt ciphertext
- Non-repudiation can only be achieved through asymmetric cryptography
 - Digital Signature

Summary

- RSA and ECC: encryption and digital signatures
 - Private key is used for signing and decryption
 - Public key is used for verifying and encryption
- DSA: digital signatures only

public-key system	mathematical problem	example
Integer factorization	Given a number n , find its prime factors	RSA, Rabin-Williams
Discrete logarithm	Given a prime n , and numbers g and h , find x such that $h = g^x \pmod n$	ElGamal, Diffie-Hellman, DSA
Elliptic curve discrete logarithm	Given an elliptic curve E and points P and Q on E , find x such that $Q = xP$	EC-Diffie-Hellman, ECDSA, ECMQV

Writing Assignments

- How do Digital Signatures assure non-repudiation?
- Since Asymmetric Cryptography is so versatile, can it replace Symmetric Cryptography completely?
